Blockchain & Identity Management/Digital Identity: The Value Proposition

WEB 3.0 WAY OF DOING THINGS

Decentralized Identity

Blockchains and DLTs aren't perfect, but they're the **best**, stablest, and most production-ready system we have today for publishing user-managed cryptographic keys **at scale**.

Different systems optimize for different variables (performance, privacy, total cost of ownership, forward-stability) but there are always **trade-offs**.

Some **innovative** work (such as KERI, Sidetree, web KMS and DKMS) are pushing the key-management envelope on other ways.

Why do we need Blockchain for Identity?

Blockchain identity management systems could be used to eradicate current identity issues such as

- Inaccessibility
- Data insecurity
- Fraudulent identities

Inaccessibility

Approximately 1.1 billion people around the world have no proof of identity, and 45% of those without an identity are among the poorest 20% on the planet. Cumbersome identification paperwork processes, expenses, lack of access, and the simple lack of knowledge around personal identity are primary roadblocks that keep over a billion individuals outside of traditional identification systems. Without possessing physical identities, one cannot enroll in school, apply for jobs, get a passport, or access many governmental services. Having an identity is crucial to gaining access to the existing financial system. Conversely, 60% of the 2.7 billion unbanked people already own mobile phones, which paves the way for blockchain-based mobile identity solutions which better suit the needs of vulnerable citizens.

Data Insecurity

At present, we store our most valuable identification information on centralized government databases supported by legacy software operate with numerous single points of failure. Large, centralized systems containing the personally identifiable information (PII) of millions of user accounts are incredibly appealing to hackers. A recent study shows that personally identifiable information is the most targeted data for breaches, comprising 97% of all breaches in 2018. Despite regulatory legislation and enterprise efforts to increase cybersecurity, 2.8 billion consumer data records were exposed at an estimated cost of more than \$654 billion in 2018.

Fraudulent Identities

Additionally, the user's digital identity landscape experience is exceptionally fragmented. Users juggle various identities associated with their usernames across different websites. There is no standardized way to use the data generated by one platform on another platform. Furthermore, the weak link between digital and offline identities makes it relatively easy to create fake identities. Fake identities create fertile ground for the phenomena of counterfeit interaction, which can help in the perpetration of fraud and lead to inflated numbers and lost revenue. In society, this vulnerability facilitates the creation and dissemination of evils like "fake news," which poses a potential threat to democracy.

Due to the increasing sophistication of smartphones, advances in cryptography and the advent of blockchain technology, we have the tools to build new identity management systems; digital identity frameworks based upon the concept of decentralized identifiers (DIDs) – potentially including a new subset of decentralized identities known as self-sovereign identity (SSI).

Goals

16

Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels

Target
16.9

By 2030, provide legal identity for all, including birth registration

GBA

16 PEACE, JUSTICE AND STRONG INSTITUTIONS
PROMOTE PEACEFUL AND INCLUSIVE SOCIETIES FOR SUSTAINABLE DEVELOPMENT, PROVIDE ACCESS TO JUSTICE FOR ALL AND BUILD EFFECTIVE, ACCOUNTABLE AND INCLUSIVE INSTITUTIONS AT ALL LEVELS

PLEAS FOR GLOBAL PEACE
GROW LOUDER

WORLD IS WITNESSING LARGEST NUMBER OF VIOLENT CONFLICTS SINCE 1946

Blockchain & Identity Management/Digital Identity: Benefits

Decentralization:

Blockchains can increase the security and privacy of digital identity, as personal information is not stored in a centralized location that could be vulnerable to hacking or other forms of attacks.

Immutability:

Information stored on a blockchain is tamper-proof and cannot be modified once added. This feature can ensure authenticity and integrity of the data stored, making it suitable for supporting identity management control processes.

Blockchain & Identity Mgmt/Digital Identity

GBA

Transparency:

Blockchains allow for transparency in the way information is shared and validated, making it possible to track the history of a digital identity, who owns it and how it has been used.

Self-Sovereign Identity:

Blockchains can support identity management systems where individuals have full control over their personal data. They can choose to share it or not, and with whom. This can enable the creation of self-sovereign identity, allowing individuals to use a single digital identity to access multiple services

Blockchain & Identity Mgmt/Digital Identity

GBA

Interoperability:

Blockchains-based identities can be linked to other digital identities across difference platforms.

Decentralized Identifiers (DIDs) v1.0

Core architecture, data model, and representations

W3C Recommendation 19 July 2022

§ 1.2 Design Goals

This section is non-normative.

Decentralized Identifiers are a component of larger systems, such as the Verifiable Credentials ecosystem [VC-DATA-MODEL], which influenced the design goals for this specification. The design goals for Decentralized Identifiers are summarized here.

Goal	Description
Decentralization	Eliminate the requirement for centralized authorities or single point failure in identifier management, including the registration of globally unique identifiers, public verification keys, services , and other information.
Control	Give entities, both human and non-human, the power to directly control their digital identifiers without the need to rely on external authorities.
Privacy	Enable entities to control the privacy of their information, including minimal, selective, and progressive disclosure of attributes or other data.
Security	Enable sufficient security for requesting parties to depend on DID documents for their required level of assurance.
Proof-based	Enable DID controllers to provide cryptographic proof when interacting with other entities.
Discoverability	Make it possible for entities to discover DIDs for other entities, to learn more about or interact with those entities.
Interoperability	Use interoperable standards so DID infrastructure can make use of existing tools and software libraries designed for interoperability.
Portability	Be system- and network-independent and enable entities to use their digital identifiers with any system that supports DIDs and DID methods .
Simplicity	Favor a reduced set of simple features to make the technology easier to understand, implement, and deploy.
Extensibility	Where possible, enable extensibility provided it does not greatly hinder interoperability, portability, or simplicity.

Access Control:

Blockchains can be used to controls access to resources based on user roles and permissions. This could be implemented by using smart contracts, where the access to a resource is granted or denied based on specific attributes and credentials of the user.

Blockchain & Identity Management/Digital Identity: Challenges

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Scalability:

Blockchains could be limited in their ability to support systems with fast increasing numbers of digital identities and associated transactions.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Privacy:

Although, blockchain can increase the privacy of digital identities, since data stored on the blockchain are visible to everyone on the network.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Complexity:

The use of blockchain requires a certain level of technical expertise. This requirement could prevent some individuals from using it.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Regulations:

Countries and jurisdictions may have different regulations regarding the use of digital identities, and blockchain-based digital identities may not comply with all the relevant requirements.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Adoptions:

Blockchain technologies are still relatively new and their adoption in support of digital identities may be limited.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Centralization:

Although, blockchains are based on decentralization, their implementation can lead to a centralization of controls over digital identities, depending on the configuration of the solution, the number of validators nodes, and the rules that govern the network.

What are the challenges of Blockchains in support of Identity Management/Digital Identity?

GBA

Interoperability:

Blockchain-based digital identities may not be compatible with other systems/solutions, making it difficult to share and digital identities across different platform.

Where do we go from here?

ID Management – The Way Forward

GBA

Work with the many identity management organizations, frameworks and standards and try to bring the blockchain solution providers together around common protocols to identify people, places, and organizations while protecting the privacy of individuals.

Conduct studies and develop proposals on how to make the needed information while protecting the sovereignty of the identity data.

DIGITAL IDENTITY COMMUNITY GROUP

The mission of the W3C Digital Identity Community Group is to identify and resolve real world identity issues, to explore and build a more secure trusted digital identity ecosystem on internet for people, organizations and things fully controlling, protecting and expressing their identity. Our work focuses on the ecosystem's scalability, interoperability, mobility, security and privacy. We intend to integrate interoperable identity solutions, systems and networks in our ecosystem.
